

**Undercut pickup cavities that accommodate the offset
overhanging baseplate of a regular Strat pickup
&
How to cut them from non-undercut cavities.**

Typical offset baseplate of Strat pickups.

IMPORTANT: After making the cut **STOP** the machine to a complete rest before withdrawing the cutter from the guitar. Reason is if a spinning cutter is lifted out and is not positioned within the footprint of the pickup cover a undesirable piece of wood will be removed. The desired cut should not be seen from the outside.
